### Field of the Invention

The present invention relates to novel antidiabetic compounds, their tautomeric forms, their derivatives, their analogues, their stereoisomers, their polymorphs, their pharmaceutically acceptable salts, their pharmaceutically acceptable solvates and pharmaceutically acceptable compositions containing them. This invention particularly relates to novel azolidinedione of the general formula (I), their derivatives, their analogues, their tautomeric forms, their stereoisomers, their polymorphs and their pharmaceutically acceptable salts, pharmaceutically acceptable solvates and pharmaceutical compositions containing them.

The present invention also relates to a process for the preparation of the above said novel azolidinedione compounds, their analogues, their derivatives, their tautomeric forms, their stereoisomers, their polymorphs, their pharmaceutically acceptable salts, pharmaceutically acceptable solvates, and pharmaceutical compositions containing them.

This invention also relates to novel intermediates, processes for preparing the intermediates and processes for using the intermediates.

The azolidinediones of the general formula (I) defined above of the present invention are useful for the treatment and / or prophylaxis of hyperlipemia, hypercholesteremia, hyperglycemia, osteoporosis, obesity, glucose intolerance, insulin resistance and also diseases or conditions in which insulin resistance is the underlying pathophysiological mechanism. Examples of these diseases and conditions are type II diabetes, impaired glucose tolerance, dyslipidaemia, hypertension, coronary heart

- 2 -

5 disease and other cardiovascular disorders including atherosclerosis. The  
azolidinediones of the formula (I) are useful for the treatment of insulin resistance  
associated with obesity and psoriasis. The azolidinediones of the formula (I) can also  
be used to treat diabetic complications and can be used for treatment and / or  
prophylaxis of other diseases and conditions such as polycystic ovarian syndrome  
10 (PCOS), certain renal diseases including diabetic nephropathy, glomerulonephritis,  
glomerular sclerosis, nephrotic syndrome, hypertensive nephrosclerosis, end-stage  
renal diseases and microalbuminuria as well as certain eating disorders, as aldose  
reductase inhibitors and for improving cognitive functions in dementia.

#### Background of the Invention

15 Insulin resistance is the diminished ability of insulin to exert its biological  
action across a broad range of concentrations. In insulin resistance, the body secretes  
abnormally high amounts of insulin to compensate for this defect; failing which, the  
plasma glucose concentration inevitably rises and develops into diabetes. Among the  
developed countries, diabetes mellitus is a common problem and is associated with a  
20 variety of abnormalities including obesity, hypertension, hyperlipidemia (J. Clin.  
Invest., (1985) 75 : 809 - 817; N. Engl. J. Med. (1987) 317 : 350 - 357 ; J. Clin.  
Endocrinol. Metab., (1988) 66 : 580 - 583; J. Clin. Invest., (1975) 68 : 957 - 969) and  
other renal complications (See Patent Application No. WO 95/21608). It is now  
increasingly being recognized that insulin resistance and relative hyperinsulinemia  
25 have a contributory role in obesity, hypertension, atherosclerosis and type 2 diabetes  
mellitus. The association of insulin resistance with obesity, hypertension and angina  
has been described as a syndrome having insulin resistance as the central pathogenic  
link-Syndrome-X. In addition, polycystic ovarian syndrome (Patent Application No.  
WO 95/07697), psoriasis (Patent Application No. WO 95/35108), dementia  
30 (Behavioral Brain Research (1996) 75 : 1 - 11) etc. may also have insulin resistance as  
a central pathogenic feature. Recently, it has also been reported that thiazolidinediones  
improve the bone mineral density and thus may be useful for the treatment of  
osteoporosis (EP-783888).

A number of molecular defects have been associated with insulin resistance.  
35 These include reduced expression of insulin receptors on the plasma membrane of  
insulin responsive cells and alterations in the signal transduction pathways that become

- 3 -

- 5 activated after insulin binds to its receptor including glucose transport and glycogen synthesis.

Since defective insulin action is thought to be more important than failure of insulin secretion in the development of non-insulin dependent diabetes mellitus and other related complications, this raises doubts about the intrinsic suitability of antidiabetic treatment that is based entirely upon stimulation of insulin release. Recently, Takeda has developed a new class of compounds which are the derivatives of 5-(4-alkoxybenzyl)-2,4-thiazolidinediones of the formula (II) (Ref. *Chem. Pharm. Bull.* 1982, 30, 3580-3600). - Mutation in colonies of laboratory animals and different sensitivities to dietary regimens have made the development of animal models with non-insulin dependent diabetes associated with obesity and insulin resistance possible. Genetic models such as db/db and ob/ob (See Diabetes, (1982) 31(1) : 1- 6) in mice and fa/fa and Zucker rats have been developed by the various laboratories for understanding the pathophysiology of disease and testing the efficacy of new antidiabetic compounds (Diabetes, (1983) 32: 830-838 ; Annu. Rep. Sankyo Res. Lab. (1994). 46 : 1-57). The homozygous animals, C57 BL/KsJ-db/db mice developed by Jackson Laboratory, US, are obese, hyperglycemic, hyperinsulinemic and insulin resistant (J. Clin. Invest., (1990) 85 : 962-967), whereas heterozygous are lean and normoglycemic. In db/db model, mouse progressively develops insulinopenia with age, a feature commonly observed in late stages of human type II diabetes when blood sugar levels are insufficiently controlled. The state of pancreas and its course vary according to the models. Since this model resembles that of type II diabetes mellitus, the compounds of the present invention were tested for blood sugar and triglycerides lowering activities.

5       The compounds of the present inventions showed blood sugar and triglycerides lowering activities through improved insulin resistance. This was demonstrated by the following *in vivo* experiments.

Male C57BL/KsJ-db/db mice of 8 to 14 weeks age, having body weight range of 35 to 60 grams, procured from the Jackson Laboratory, USA, were used in the  
10   experiment. The mice were provided with standard feed (National Institute of Nutrition, Hyderabad, India) and acidified water, ad libitum. The animals having more than 300 mg / dl blood sugar were used for testing. The number of animals in each group was 4.

The random blood sugar and triglyceride levels were measured by collecting  
15   blood (100 µl) through orbital sinus, using heparinised capillary in tubes containing EDTA which was centrifuged to obtain plasma. The plasma glucose and triglyceride levels were measured spectrometrically, by glucose oxidase and glycerol-3-PO<sub>4</sub> oxidase/peroxidase enzyme (Dr. Reddy's Lab. Diagnostic Division Kits, Hyderabad, India) methods respectively. On 6th day the blood samples were collected one hour  
20   after administration of test compounds / vehicle for assessing the biological activity.

Test compounds were suspended on 0.25 % carboxymethyl cellulose and administered to test group at a dose of 10 mg to 200 mg / kg through oral gavage daily for 6 days. The control group received vehicle (dose 10 ml / kg). Troglitazone (100 mg / kg, daily dose) was used as a standard drug which showed 28 % reduction in  
25   random blood sugar level on 6th day.

The blood sugar and triglycerides lowering activities of the test compound was calculated

according to the formula:

30   Blood sugar / triglycerides lowering activity (%) =  $1 - \frac{DT/DC}{TC/ZC} \times 100$

ZC = Zero day control group value

DC = Zero day treated group value

TC = Control group value on test day

35   DT = Treated group value on the test day

No adverse effects were observed for any of the mentioned compounds of invention in the above test.

5

Compound	Dose (mg / kg)	Reduction in Blood Glucose Level (%)	Triglyceride Lowering (%)
Example 19	10	43	26
Example 6	30	49	46
Example 3	30	62	55

The experimental results from the db/db mice suggest that the novel compounds of the present invention also possess therapeutic utility as a prophylactic or regular treatment for obesity, cardiovascular disorders such as hypertension, hyperlipidaemia and other diseases; as it is known from the literature that such diseases are interrelated to each other.

Blood glucose level and triglycerides are also lowered at doses greater than 30 mg/kg. Normally, the quantum of reduction is dose dependent.

International application No.  
PCT/US 98/10612

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:
  
2. ☒ Claims Nos.: 16, 17  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:  
see FURTHER INFORMATION sheet PCT/ISA/210
  
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
  
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
  
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
  
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

## FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Claims Nos.: 16,17

Claim 16 describes the compounds (I) already claimed in claim 1 and additionally claims "its derivatives, it's analogues...., it's polymorphs". This is a speculative extension of the scope of claim 1 which cannot have been fully examined by the Applicant and whose precise limits would not have been clear to the skilled person. The search of compounds (I) has been limited to compounds (I), their salts, tautomers and isomers.

Claim 17 is a product by process claim relating to the intermediates (II) which are already claimed in claim 3. Product by process claims are only allowable if there is no other way of describing the compounds and this is clearly not the case for the present application.
